General information

Self-heating correlated to installation and ambient conditions as well as to electronics and supply voltage must be considered for precise thermal dimensioning. Operating the encoder close to the maximum limits requires measuring the real prevailing temperature at the encoder flange.

Terminal assignment

Cable	
Core color	Signals
white	0 V
brown	+Vs
green	Clock+
yellow	Clock-
grey	Data+
pink	Data-
blue	SET
red	DIR

Cable data: 4 x 2 x 0.14 mm², shielded, twisted in pairs

Terminal significance

SET	Zero setting. Input for zero setting at any position. The zero setting operation is triggered by a high pulse and has to be in line with the selected direction of rotation (DIR). Impulse duration >100 ms. Connect to 0 V after zero setting for maximum interference immunity.
DIR	Counting direction input. The input is standard on high. For maximum interference immunity connect to +Vs respectively 0 V depending on counting direction. CW HIGH - CCW LOW (Version with DATAVALID does not include the counting direction input).

Trigger level

Control inputs	Input circuit
Maximal	0...+Vs
Input level Low	<1 V
Input level High	>2.1 V

Applies to standard cable lengths up to 2 m, for longer cables the voltage drop must be taken into account.

Data transfer

Output signal

$T = 0.5 \dots 10 \mu\text{s}$	$t_1 = 0.25 \dots 5 \mu\text{s}$
$t_2 = 20 \pm 2 \mu\text{s}$	$f \text{ max.} = 2 \text{ MHz}$

Data acquisition time ta

Following timing of the SSI Masters is the requirement for a data refresh rate of typ. 2 μs . If this is not fulfilled the data refresh rate is <50 μs .
 $t_a < 5000 \mu\text{s}$
 $t_a \text{ jitter} < \pm 2 \mu\text{s}$

Angular misalignment

Working distance

The ideal working distance of the magnet related to the encoder is at an eccentricity of 0 mm and an axial distance of 0.9 mm. Deviation affects the accuracy as shown in following diagram.
